The Parallel Postulate states that there exists one line through C which is parallel to line AB. As you know, an infinite number of lines can be drawn through point C, but only one of them will be parallel to line AB. The parallel postulate is very important in doing geometric proofs. It is basically a way to formally say that when given one line, you can always draw another line somewhere that will be parallel to the given line. In the problem section we'll see how to use the parallel ...

On a sphere, two lines can be parallel and still intersect each other not once but twice, the sum of the angles of a triangle is greater than 180 °, and the shortest distance between two points on a sphere is along the perimeter of a great circle, which is not necessarily a straight line on a flattened map. As the Earth's shape is roughly approximated by a sphere, these properties of spherical geometry aided explorers in charting out the globe and astronomers in plotting the course of ...

The symbol for " parallel to " is " // ". Parallel lines are the lines which never meet each other. For the two lines to be parallel, the most important thing is that they are drawn in the same plane. These lines are always equidistant from each other. What is a Transversal? A transversal is a line that passes through two lines lying in the same plane at two distinct points. In the transversal, the two given lines may be parallel or non-parallel.

It is a time of fear for many people, but Denise Godwin of International Media Ministries (IMM) finds a parallel between the coronavirus and a plague that ravished Rome and the surrounding lands roughly AD 250-270. (Photo courtesy of International Media Ministries) She says IMM was shooting the story of Cyprian, a bishop of Carthage. The plague was actually named after him because he rallied the Christians to care for the sick and even attend to burial for the dead.
